

PHOT 222: Quantum Photonics

LECTURE 14

Michaël Barbier, Spring semester (2024-2025)

OVERVIEW OF THE COURSE

week	topic	Serway 9 th	Young
Week 1	Relativity	Ch. 39	Ch. 37
Week 2	Waves and Particles	Ch. 40	Ch. 38-39
Week 3	Wave packets and Uncertainty	Ch. 40	Ch. 38-39
Week 4	The Schrödinger equation and Probability	Ch. 41	Ch. 39
Week 5	Midterm exam 1		
Week 6	Quantum particles in a potential	Ch. 41	Ch. 40
Week 7	Bayram		
Week 8	Harmonic oscillator	Ch. 41	Ch. 40
Week 9	Tunneling through a potential barrier	Ch. 41	Ch. 40
Week 10	Midterm exam 2		
Week 11	Bohr's hydrogen atom, absorption/emission spectra	Ch. 42	Ch. 41
Week 12	Quantum mechanical model of the hydrogen atom	Ch. 42	Ch. 41
Week 14	Spin / Many-electron atoms	Ch. 42	Ch. 41
Week 14	Molecules, Crystalline materials & energy band structure	Ch. 43	Ch. 42

Normal Zeeman Effect: Applying a Magnetic Field

MAGNETIC MOMENT BY CURRENT

- Current around an area creates a magnetic field
 - **Magnetic dipole moment:** $\vec{\mu} = I\vec{A}$
 - Depends on the current/charge
 - Current is charge per time: $I = \frac{e}{T}$

1897 Thomas Edison "O"
Bipolar Utility Motor

Edison Small Power Battery Motors.

Edison Battery Motor No. 0.

$\frac{1}{4}$ Scale.

This motor is suitable for Jewelers' and Dental lathes, where only small power is desired. It is furnished with ball bearings, and is of very high efficiency.

Price, - - \$15.00.

Edison Battery Motor No. 00.

$\frac{1}{4}$ Scale.

This motor is designed for heavier work, such as sewing machines, electric pianos, railroad semaphores, etc., and is also equipped with ball bearings.

Price, - - - \$25.00.

The above motors, both of which are of the Paccinotti ring type, are of the very best construction, and are suitable for operating dental engines, jewelers' and dental lathes, sewing-machines, electric pianos, etc., etc. In designing them, special attention has been directed to produce motors of high efficiency, which is of far greater importance in battery motors than in small motors running on the light circuit, on account of the cost of the maintenance of the battery being reduced to a minimum when a motor of high economy is used.

MAGNETIC MOMENT OF AN ORBITING ELECTRON

- Bohr: electron going along an orbit

- Angular momentum: $\vec{L} = m_e \vec{v} \times \vec{r}$

- Magnetic dipole moment:** $\vec{\mu} = I \vec{A}$

- Current is charge per time: $I = \frac{e}{T}$

$$\Rightarrow \mu = IA = \frac{e v}{2\pi r} \cdot \pi r^2 = \frac{evr}{2}$$

- Substitute $L = m_e v r$

$$\Rightarrow \mu = \frac{evr}{2} = \frac{e}{2m_e} L$$

with **gyromagnetic ratio**: $\frac{\mu}{L} = \frac{e}{2m_e}$

MAGNETIC FIELD APPLIED TO AN ORBITING ELECTRON

- Magnetic dipole moment: $\vec{\mu} = -\frac{e\vec{L}}{2m_e}$
- dipole $\vec{\mu}$ in magnetic field \vec{B} undergoes torque $\vec{\tau} = \vec{\mu} \times \vec{B}$

$$\Rightarrow U = -\vec{\mu} \cdot \vec{B}$$

- In the ground state the Bohr model has $L = \hbar$ giving a nonzero magnetic moment

$$\mu = \frac{eL}{2m_e} = \frac{e\hbar}{2m_e} = \mu_B \quad \leftarrow \text{Bohr magneton } \mu_B = 5.788 \times 10^{-5} \frac{\text{eV}}{T}$$

- According to Schrodinger's equation:
 - Electron in s-state with zero angular momentum?

APPLYING A MAGNETIC FIELD

- Quantum Mechanics:

- Quantized angular momentum: $\vec{L} = \sqrt{l(l+1)}\hbar$
- Magnetic quantum number: $L_z = m_l \hbar$

- Gyromagnetic ratio $\frac{\mu}{L} = \frac{e}{2m_e}$ still valid

- Magnetic field along z-axis: $U = -\vec{\mu} \cdot \vec{B} = -\mu_z B$

- Magnetic moment quantized:

$$\mu_z = -\frac{e}{2m_e} L_z = -m_l \frac{e\hbar}{2m_e} = -m_l \mu_B$$

➡ $U = -\mu_z B = m_l \mu_B B$

APPLYING A MAGNETIC FIELD

- No magnetic field: Energy depends only on quantum number n :

$$E_n = -\frac{Z^2}{n^2} \cdot 13.6 \text{ eV}$$

$$\vec{B} = 0$$

- Magnetic field B results $E_n \rightarrow E_n + U_B$:

$$E_n = E_n + m_l \mu_B B \text{ with } m_l = -l, \dots, l$$

$$\vec{B} \uparrow$$

- Normal Zeeman effect:** splitting E_n in $2n - 1$ levels
- The splitting scales with magnetic field B

APPLYING A MAGNETIC FIELD

- No magnetic field: Energy depends only on quantum number n :

$$E_n = -\frac{Z^2}{n^2} \cdot 13.6 \text{ eV}$$

- Magnetic field B results $E_n \rightarrow E_n + U_B$:

$$E_n = E_n + m_l \mu_B B \text{ with } m_l = -l, \dots, l$$

- Normal Zeeman effect:** splitting E_n in $2l + 1$ levels
- The splitting scales with magnetic field B
- Spectral lines split according **selection rules**

$$\lambda = 643.8 \text{ nm}$$

Adapted from the course of Werner Boeglin

SELECTION RULES

$$E_n = E_n + m_l \mu_B B \quad \text{with} \quad m_l = -l, \dots, l$$

- Angular momentum should be conserved
- A photon uses one unit \hbar of angular momentum
- Selection rules:

1. Orbital quantum number $l \rightarrow l - 1$

2. Magnetic quantum number:

$$m_l \rightarrow m_l \pm 1 \quad \text{or} \quad m_l \rightarrow m_l$$

Allowed & forbidden transitions

$$\lambda = 643.8 \text{ nm}$$

Adapted from the course of Werner Boeglin

EXAMPLE NORMAL ZEEMAN SPLITTING: SOLAR SPOTS

- Solar spots are regions in the sun:
 - Lower in temperature (3000-4500 K vs 5800 K)
 - Move around the sun in time, towards the equator

Adapted from Wikipedia, Original image taken by Alan Friedman in 2012.

EXAMPLE NORMAL ZEEMAN SPLITTING: SOLAR SPOTS

- Solar spots are regions in the sun:
 - Lower in temperature (3000-4500 K vs 5800 K)
 - High magnetic flux density

Adapted from "Spots on the Sun", article at cosmosatyourdoorstep.com

EXAMPLE NORMAL ZEEMAN SPLITTING: SOLAR SPOTS

- Measure magnetic field by the Zeeman effect

Zeeman splitting
($B = 0.41$ Tesla)

Fe line at 525 nm

Sunspot 1974

Electron Spin

THE SODIUM DOUBLET LINE

- Spectrum Sodium (Na) doublet line
- Transition: $3p \rightarrow 3s$
- Effect of electron spin splits a single orbital in two energy-levels

THE SODIUM DOUBLET LINE

- Spectrum Sodium (Na) doublet line
- What is the reason for this small energy difference?

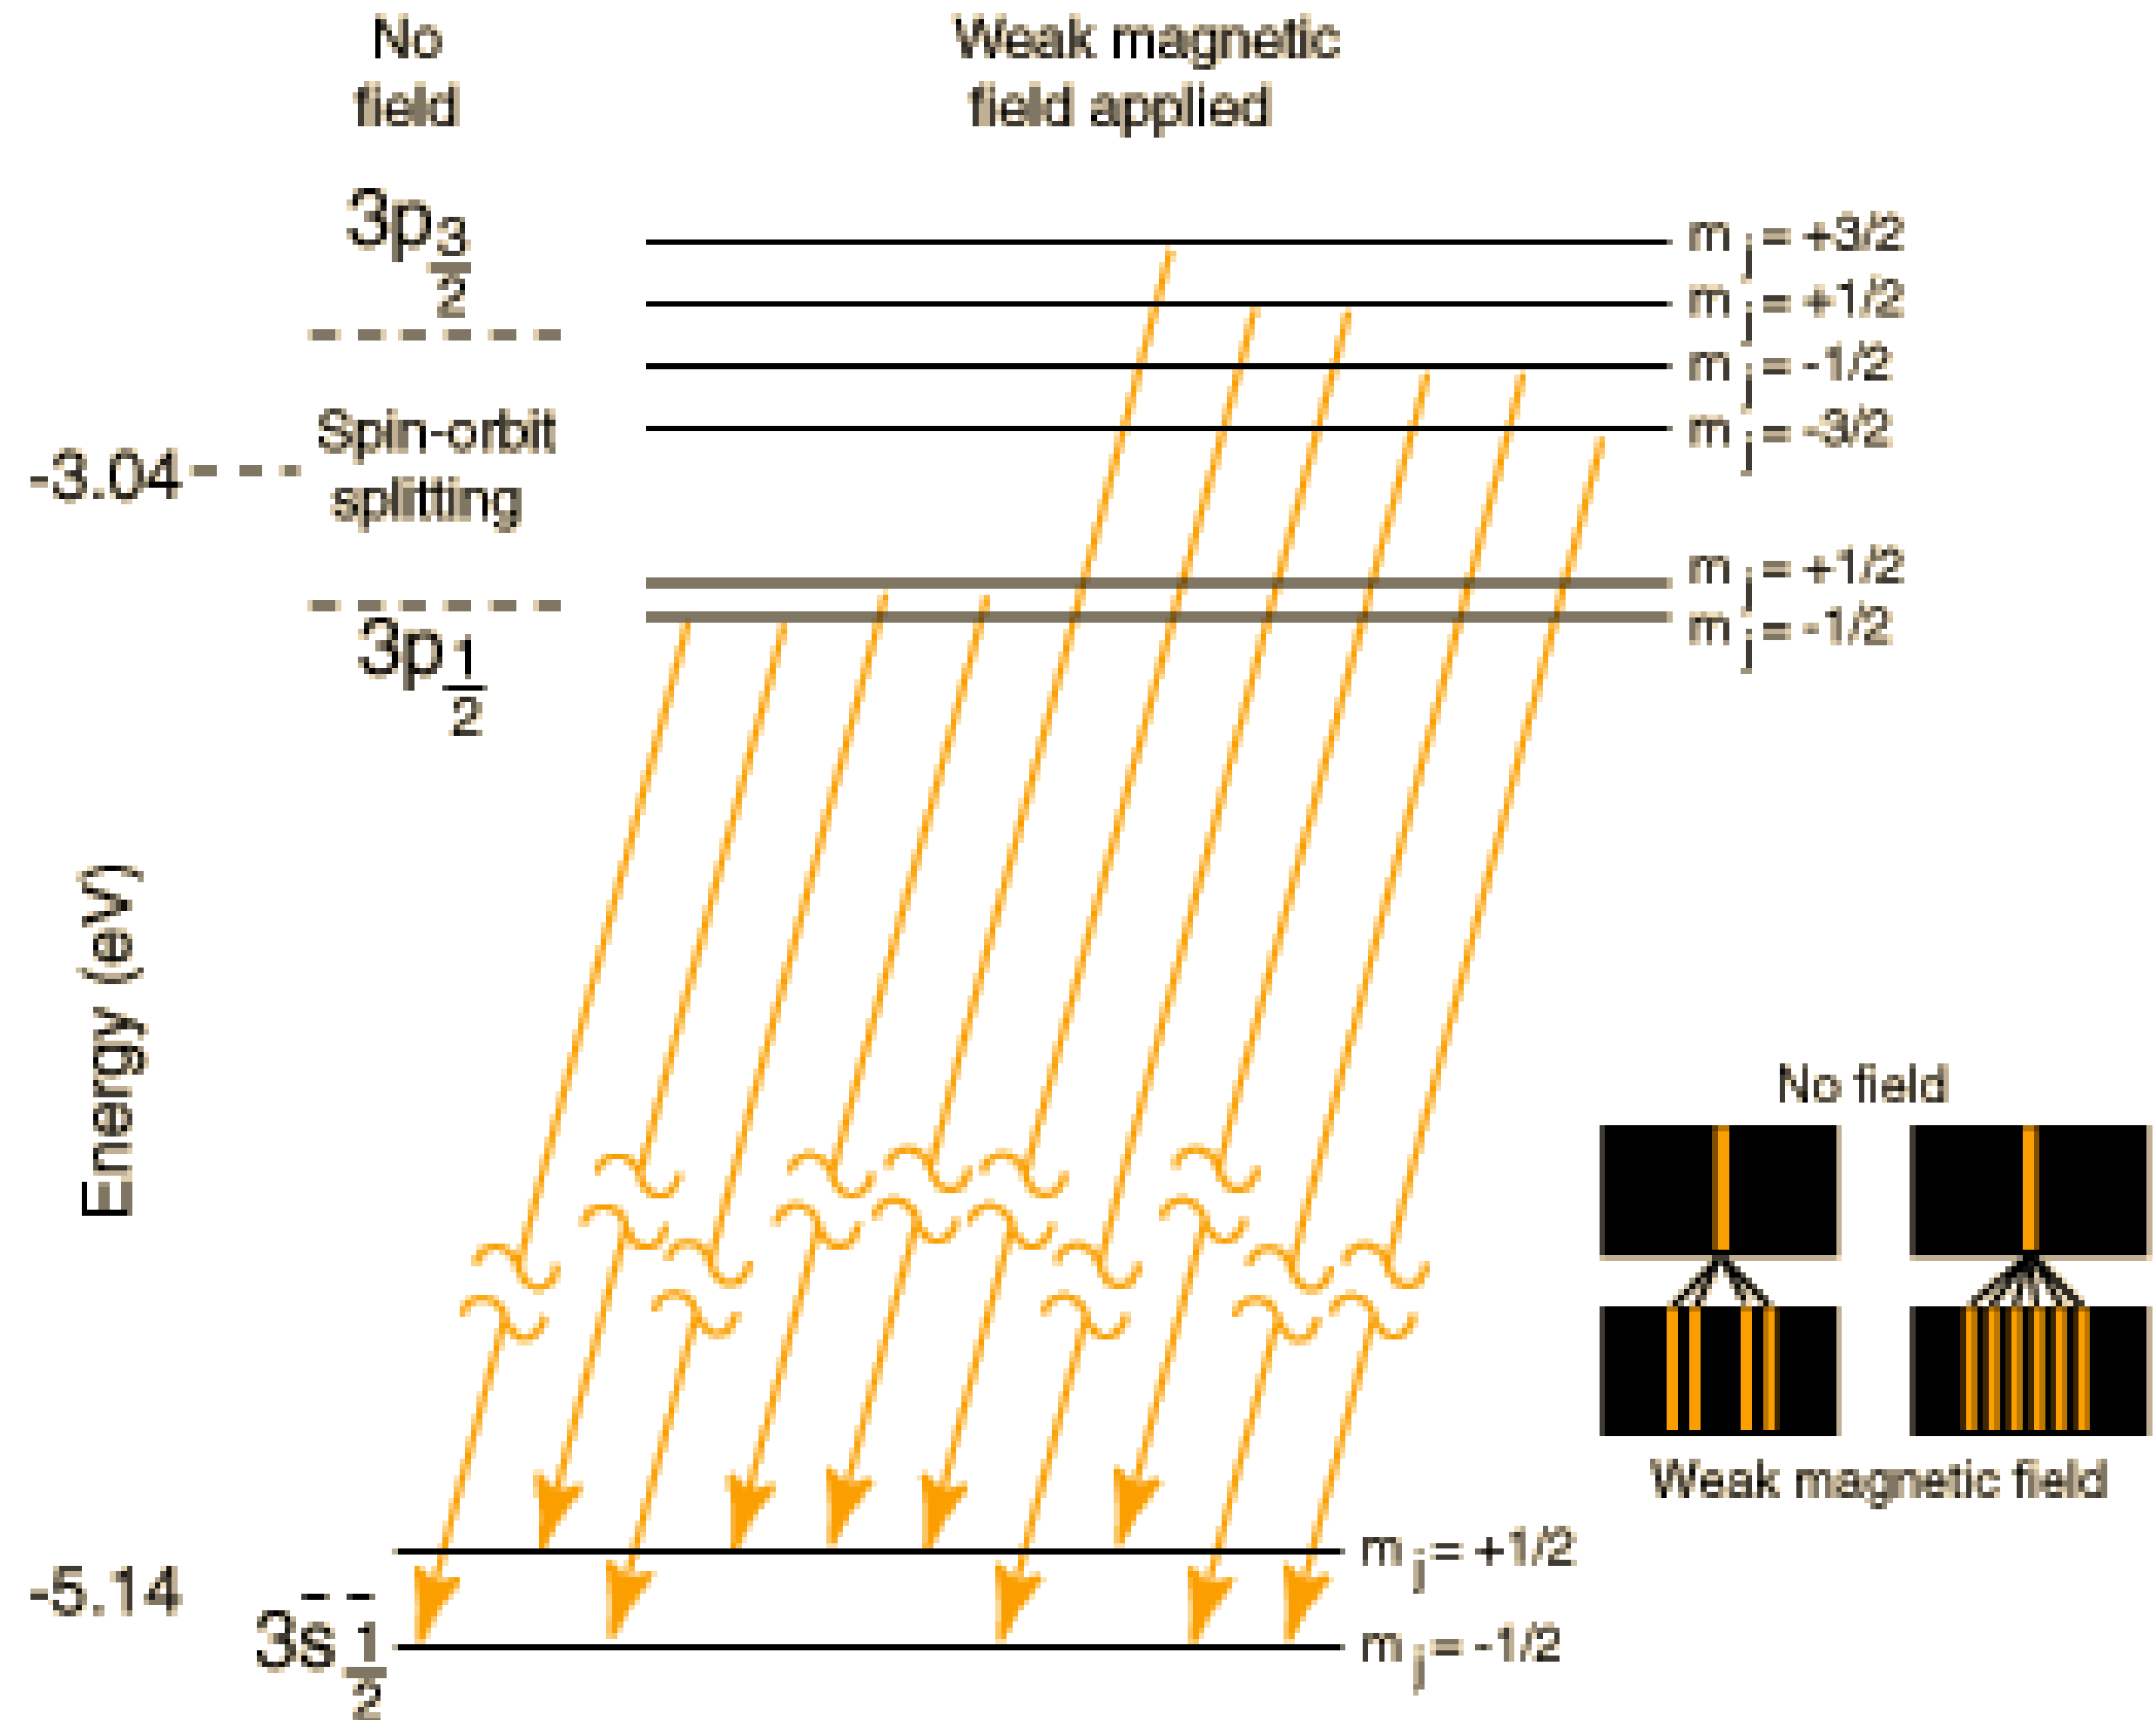

THE ANOMALOUS ZEEMAN SPLITTING

- **1896: Zeeman splitting** of Sodium doublet line by magnetic field
(electron not yet discovered)

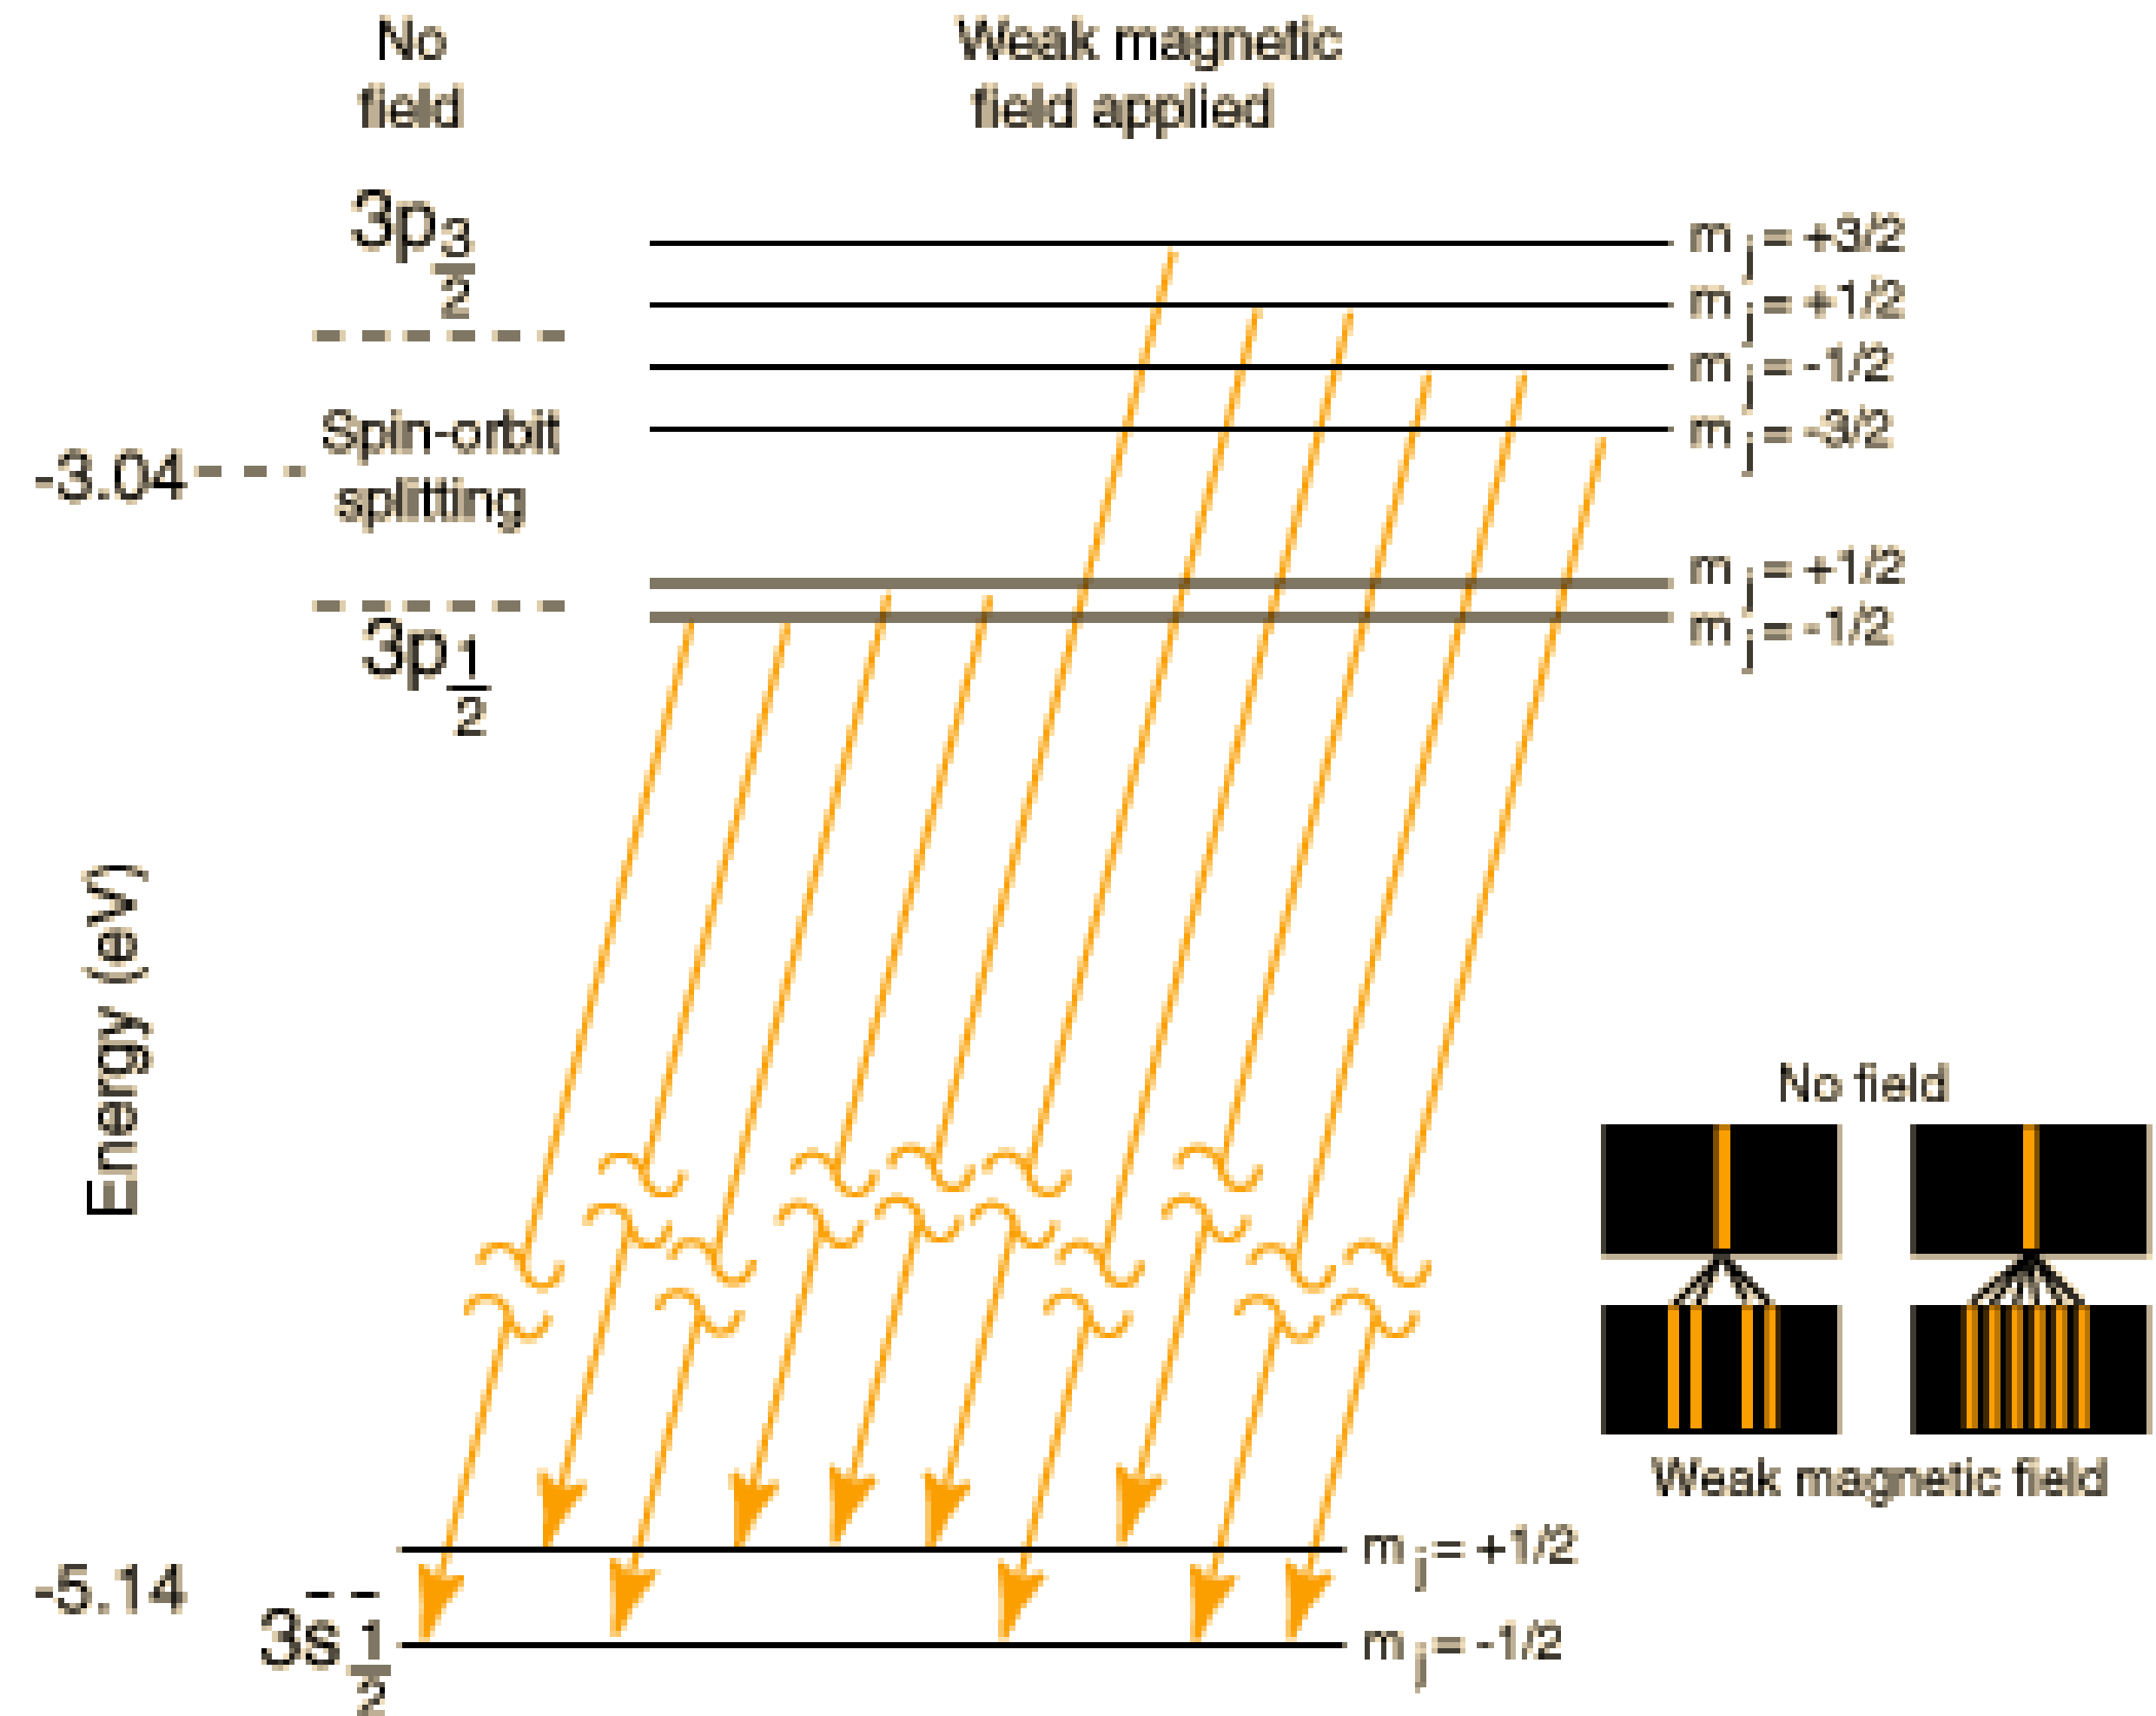

Pieter Zeeman

THE ANOMALOUS ZEEMAN SPLITTING

- **1896: Zeeman splitting** of Sodium doublet line by magnetic field
(electron not yet discovered)
- No logical explanation when using only quantum numbers n, l, m_l ?
- Solution: extra quantum number - **spin magnetic quantum number**

THE IDEA OF SPIN

- The Schrodinger equation does not predict spin
- **1925**: Goudsmit & Uhlenbeck propose extra quantum number m_s
- Analogy of spinning Earth? No ...

Samuel Goudsmit

George Uhlenbeck

Wolfgang Pauli

THE IDEA OF SPIN

- Similar to analysis of angular momentum:

- Magnitude of spin:
$$S = \sqrt{\frac{1}{2} \left(\frac{1}{2} + 1 \right)} \hbar = \sqrt{\frac{3}{4}} \hbar$$

- Spin quantum number:
$$S_z = m_s \hbar = \pm \frac{1}{2} \hbar$$

- Spin magnetic moment:

$$\mu_z = - \frac{(2.0023) \mu_B S_z}{\hbar} \approx - \frac{2 \mu_B S_z}{\hbar}$$

- Spin will just as the angular momentum contribute to a magnetic moment

TOTAL ANGULAR MOMENTUM J

• The **total angular momentum**: $\vec{J} = \vec{L} + \vec{S}$

• Magnitude total angular momentum: $J = \sqrt{j(j+1)} \hbar$

Orbital magnetic quantum number: $m_l = -l, \dots, -1, 0, 1, \dots, l$

Spin magnetic quantum number: $m_s = -s, \dots, -\frac{1}{2}, \frac{1}{2}, \dots, s$

Total angular momentum quantum number: $m_j = -j, \dots, j$

$$m_j = m_l + m_s$$

Notation for orbitals :

FINE STRUCTURE OF THE HYDROGEN ATOM

- Magnetic moments originating from electron orbit and spin:

$$\mu_z = -\frac{\mu_B L_z}{\hbar} \quad \text{and} \quad \mu_{z,\text{spin}} \approx -\frac{2\mu_B S_z}{\hbar}$$

- Magnetic moments lead to potential energy contributions
- Energy depends not only on n but also on j :

$$E_{n,j} = -\frac{13.6 \text{ eV}}{n^2} \times \left[1 + \frac{\alpha^2}{n^2} \left(\frac{n}{j + \frac{1}{2}} - \frac{3}{4} \right) \right]$$

- The **fine structure constant** $\alpha = \frac{1}{4\pi\epsilon_0} \frac{e^2}{\hbar c} \approx 7.297 \times 10^{-3} \approx \frac{1}{137}$

Many Electron Atoms

MULTI-ELECTRON ATOMS

- Atoms with higher atom numbers have more electrons and protons
- Number of protons gives the atom number Z
- The weight of the atom can be larger as protons are “separated” by neutrons

- The multiple electrons fill up possible orbitals
- **1869:** Periodic table of Mendeljeev
 - Elements ordered in 8 groups

ELEMENTS.					
	Hydrogen.	1		Strontian	46
	Azote	5		Barytes	68
	Carbon	54		Iron	50
	Oxygen	7		Zinc	56
	Phosphorus	9		Copper	56

MULTI-ELECTRON ATOMS

- Atoms with higher atom numbers have more electrons and protons
- Number of protons gives the atom number Z
- The weight of the atom can be larger as protons are “separated” by neutrons

- The multiple electrons fill up possible orbitals
- **1869**: Periodic table of Mendeljeev
 - Elements ordered in 8 groups

Periodic Table of the Elements

The periodic table displays elements organized by atomic number (1 to 118). Elements are color-coded by group and subcategory. The legend indicates:

- State of matter (color of name):** GAS (blue), LIQUID (green), SOLID (red), UNKNOWN (grey).
- Subcategory in the metal-metalloid-nonmetal trend (color of background):**
 - Alkali metals (red)
 - Alkaline earth metals (orange)
 - Transition metals (blue)
 - Lanthanides (light blue)
 - Actinides (dark blue)
 - Post-transition metals (light green)
 - Metalloids (yellow)
 - Reactive nonmetals (light yellow)
 - Noble gases (pink)
 - Unknown chemical properties (grey)

1925: PAULI EXCLUSION PRINCIPLE

No two electrons (fermions) can be in the same quantum state

Electrons in a single atom cannot have all same quantum numbers: n, l, m_l, m_s

- For shell n we have:
 - $n \cdot (2n - 1)$ orbitals
 - Maximum $n \cdot (2n - 1) \cdot 2$ electrons, each orbital can have one spin-up and one spin-down electron

Wolfgang Ernst Pauli
Taken from Wikipedia

SPECTRA OF MULTI-ELECTRON ATOMS

- Energy levels for the electrons?
- Each electron is attracted to the positive nucleus (charge $+eZ$)

$$E_n = -\frac{Z^2}{n^2} \times 13.6 \text{ eV}$$

- But the electrons also interact with each other (repulsion)

Adapted from: www.hyperphysics.phy-astr.gsu.edu

CENTRAL-FIELD APPROXIMATION

- Problem: Electrons interact with each other?
- Inner shells are closer to the nucleus
- If only 1 valence electron: interaction minimal
- Inner electrons shield nucleus partially (max. $Z - 1$)

$$Z > Z_{\text{eff}} > 1$$

$$E_n = -\frac{Z_{\text{eff}}^2}{n^2} \times 13.6 \text{ eV}$$

Adapted from: www.hyperphysics.phy-astr.gsu.edu

SPECTRA OF MULTI-ELECTRON ATOMS

$$Z > Z_{\text{eff}} > 1$$

- Screening is more effective if farther away: $Z_{\text{eff}} \rightarrow 1$
- Lower states have higher Z_{eff}
- Z_{eff} can strongly depend on orbital quantum number l
- s and p states can have different energy

$$E_n = -\frac{Z_{\text{eff}}^2}{n^2} \times 13.6 \text{ eV}$$

NOTATION FOR ELECTRON CONFIGURATIONS

- Orbital notation (without m_l)
- Use superscript to indicate the number of electrons in the orbital
- Example:

Nitrogen: $1s^2 2s^2 2p^3$

- **1925:** Hund proposes Hund's rules

Electrons prefer to occupy empty orbitals in the same shell first with parallel (up or down spin)

Friedrich Hund
